Safety & Maintenance Instructions, Warnings, and Notes

2.1 **Safety Instructions For Repairs**

Safety regulations require that during a repair:

- Due to the 'hot' parts of this chassis, the set must be connected to the AC power via an isolation transformer.
- Safety components, indicated by the symbol **A**, should be replaced by components identical to the original ones.
- When replacing the CRT, safety goggles must be worn.

Safety regulations require that after a repair, the set must be returned in its original condition. Pay particular attention to the following points:

- General repair instruction: as a strict precaution, we advise you to re-solder the solder connections through which the horizontal deflection current is flowing, in particular:
 - all pins of the line output transformer (LOT)
 - fly-back capacitor(s)
 - S-correction capacitor(s)
 - line output transistor
 - pins of the connector with wires to the deflection coil
 - other components through which the deflection current

Note: This re-soldering is advised to prevent bad connections due to metal fatigue in solder connections and is therefore only necessary for television sets more than two years old.

- Route the wire trees and EHT cable correctly and secure them with the mounted cable clamps.
- Check the insulation of the AC power cord for external
- Check the strain relief of the AC power cord for proper function, to prevent the cord from touching the CRT, hot components, or heat sinks.
- Check the electrical DC resistance between the AC plug and the secondary side (only for sets that have an isolated power supply). Do this as follows:
 - 1. Unplug the AC power cord and connect a wire between the two pins of the AC plug.
 - 2. Turn on the main power switch (keep the AC power cord unplugged!).
 - 3. Measure the resistance value between the pins of the AC plug and the metal shielding of the tuner or the aerial connection of the set. The reading should be between 4.5 M Ω and 12 M Ω .
 - 4. Switch the TV OFF and remove the wire between the two pins of the AC plug.
- Check the cabinet for defects, to prevent the possibility of the customer touching any internal parts.

2.2 **Maintenance Instructions**

It is recommended to have a maintenance inspection carried out by qualified service personnel. The interval depends on the usage conditions:

- When the set is used under normal circumstances, for example in a living room, the recommended interval is three to five years.
- When the set is used in an environment with higher dust, grease or moisture levels, for example in a kitchen, the recommended interval is one year.
- The maintenance inspection includes the following actions:
 - 1. Perform the 'general repair instruction' noted above.
 - 2. Clean the power supply and deflection circuitry on the
 - Clean the picture tube panel and the neck of the picture

2.3 Warnings

In order to prevent damage to ICs and transistors, avoid all high voltage flashovers. In order to prevent damage to the picture tube, use the method shown in Fig. 2-1, to discharge the picture tube. Use a high voltage probe and a multi-meter (position VDC). Discharge until the meter reading is 0 V (after approx. 30 s).

Figure 2-1

- All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD) . Careless handling during repair can reduce life drastically. When repairing, make sure that you are connected with the same potential as the mass of the set by a wristband with resistance. Keep components and tools also at this potential. Available ESD protection equipment:
 - Complete kit ESD3 (small tablemat, wristband, connection box, extension cable, and ground cable) 4822 310 10671.
 - Wristband tester 4822 344 13999.
- Together with the deflection unit and any multi-pole unit, flat square picture tubes form an integrated unit. The deflection and the multi-pole units are set optimally at the factory. Adjustment of this unit during repair is therefore not recommended.
- Be careful during measurements in the high voltage section and on the picture tube.
- Never replace modules or other components while the unit is switched ON.
- When you align the set, use plastic rather than metal tools. This will prevent any short circuits and the danger of a circuit becoming unstable.

2.4 **Notes**

- Measure the voltages and waveforms with regard to the chassis (= tuner) ground ($\frac{1}{2}$), or hot ground ($\frac{1}{2}$), depending on the area of circuitry being tested.
- The voltages and waveforms shown in the diagrams are indicative. Measure them in the Service Default Mode (see chapter 5) with a color bar signal and stereo sound (L: 3 kHz, R: 1 kHz unless stated otherwise) and picture carrier at 475.25 MHz (PAL) or 61.25 MHz (NTSC, channel 3).
- Where necessary, measure the waveforms and voltages with $(\sqcap \Gamma)$ and without $(\nearrow \Gamma)$ aerial signal. Measure the voltages in the power supply section both in normal operation (1) and in standby (1). These values are indicated by means of the appropriate symbols.
- The picture tube panel has printed spark gaps. Each spark gap is connected between an electrode of the picture tube and the Aquadag coating.
- The semiconductors indicated in the circuit diagram and in the parts lists are completely interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.

Directions for Use

O Positioning the television set

Installing your television set

Place your TV on a solid, stable surface, leaving set such as a cloth or cover, a container full of To avoid accidents, do not put anything on the a space of at least 5 cm around the appliance. liquid (vase) or a heat source (lamp). The set must not be exposed to water.

@ Connections

- Insert the aerial plug into the ¬I¬ socket at
 - If you are using an indoor aerial, reception may be insert the radio aerial socket into the FM reception by rotating the aerial. If the reception ANT socket using the adapter supplied. · For the versions equipped with a radio: difficult in certain conditions. You can improve the rear of the set.
- remains poor, you will need to use an external aerial. Insert the mains plug into a wall socket (220. 240 V / 50 Hz).

16:9 Formats

(conventional screen). 4:3 pictures sometimes have a black band at the top and bottom of the screen The pictures you receive may be transmitted in 16.9 format (wide screen) or 4.3 format (letterbox format). This function allows you to optimise the picture display on screen.

Automatic switching

This TV set is also equipped with automatic switching which will select the correct-screen format, provided the specific signals are transmitted with the programmes.

Using the different screen formats

This automatic format can olso be modified manually.

Press the \bigcirc key (or \bigcirc) to select the different modes:

4:3, Zoom 14:9, Zoom 16:9, Subtitle Zoom, Super Wide and Widescreen.

You can also access these settings with key 📵.

4:3 Mode

The picture is reproduced in 4:3 format and a black band is displayed on either side of the picture. The picture may be progressively enlarged using the 🖎 keys.

Zoom 14:9 ModeThe picture is enlarged to 14:9 format, a thin black band remains on both sides of the picture. The ○○ keys allow you to compress and move the image vertically to view the top or bottom of the picture (subtitles).

Zoom 16:9 Mode

bands at the top and bottom (letterbox format).

Use the SS keys if you wish to compress and move the image vertically to view the top or bottom of the picture. The picture is enlarged to 16:9 format. This mode is recommended when displaying pictures which have black

Directions for Use

Subtitle Zoom Mode

This mode is used to display 4:3 pictures using the full surface of the screen leaving the sub-titles visible. Use the ��� keys to increase or decrease the compression at the bottom of the screen.

Super Wide Mode

The 🔿 🗢 keys allow you to scroll the image up or down surface of the screen by enlarging the sides of the picture. This mode is used to display 4:3 pictures using the full

Widescreen Mode

Note: If you display a 4:3 picture in thid mode, it will be enlarged horizontally. This mode restores the correct proportions of pictures transmitted in 16:9 using full screen display.

6

EN 10

The television has 2 external sockets situated at the back of the set (EXT1 and EXT2). The EXT2 socket has audio, CVBS/S-VHS inputs and audio, CVBS outputs. The EXT1 socket has audio, CVBS/RGB inputs and audio, CVBS outputs.

Video recorder

Carry out the connections shown opposite, using a good quality euroconnector cable.

f your video recorder does not have a euroconnector socket, the only connection possible is via the aerial cable. You will therefore need to tune in your video recorder's test signal and assign it programme number 0 (refer to manual store, p. 6). To reproduce the video recorder picture, press $(\mathbf{0})$.

Video recorder with decoder

Connect the decoder to the second euroconnector socket of the video recorder. You will then be able to record scrambled transmissions.

Other equipment

Satellite receiver, decoder, CDV, games, etc.

produces the RGB signals (digital decoder, games, etc.) to To optimise picture quality, connect the equipment which drives) to EXT2 and all other equipment to either EXT1 signals (S-VHS and Hi-8 video recorders, certain DVD EXT1, and the equipment which produces the S-VHS Carry out the connections shown opposite. or EXT2.

Amplifier (only available on certain versions)

To connect to a hi-fi system, use an audio connection cable and connect the "L" and "R" outputs on the TV set to the "AUDIO IN" "L" and "R" input on your hi-fi amplifier.

Press the key to select **EXT1**, **EXT2**, **S-VHS2** (S-VHS signals To select connected equipment

from the EXT2 socket) and AV for connections on the front panel. Most equipment (decoder, video recorder) carries out the switching itself.

Side connections

Make the connections as shown opposite. With the (4) key, select AV.

For a monophonic device, connect the audio signal to the AUDIO L input. Use the (±) key to reproduce the sound on the left and right speakers of the TV set.

When headphones are connected, the sound on the TV set will be cut. The \bigcirc **P** \bigoplus keys are used to

adjust the volume level. The headphone impedance must be between 32 and 600 Ohms.

VCR key

The remote control lets you control the main functions of the VCR.

Ξ

4. **Mechanical Instructions**

Note: Figures below can deviate slightly from the actual situation, due to the different set executions.

Rear Cover Removal 4.1

- 1. Remove all (nine) fixation screws of the rear cover: two at the top, two at each side, two at the bottom and one at the SCART connectors.
- 2. Now pull the rear cover backward to remove it.

4.2 **Service Position Main Panel**

There are 2 configurations: one without and one with panel bracket. Both have a different service position.

Main panel without bracket.

- 1. Disconnect the strain relief of the Mains cord.
- 2. Remove the main panel, by pushing the two centre clips outward [1]. At the same time pull the panel away from the CRT [2].
- 3. Disconnect the degaussing coil by removing the cable from (red) connector 0201.
- 4. Turn the panel 90 degrees counter clockwise [3].
- 5. Flip the panel 90 degrees [4], with the components towards the CRT.
- Turn the panel with the rear I/O towards the CRT [5].
- 7. Slide the metal heatsink (near the mains transformer 5520) underneath the right chassis bracket, so the panel is secured [6].

Figure 4-1

Main panel with bracket.

Mechanical Instructions

- 1. Disconnect the strain relief of the Mains cord.
- 2. Disconnect the degaussing coil by removing the cable from (red) connector 0201 [1].
- Remove the panel bracket from the bottom tray, by pulling it backward [2].
- 4. Turn the chassis tray 90 degrees counter clockwise.
- 5. Move the panel somewhat to the left and flip it 90 degrees [3], with the components towards the CRT.
- Turn the panel with the rear I/O towards the CRT.
- Place the hook of the tray in the fixation hole of the cabinet bottom [4] and secure it.

Figure 4-2

4.3 Side I/O Panel Removal (if present)

- 1. Remove the complete Side I/O assembly, after unscrewing the 2 fixation screws [1].
- 2. Release the two fixation clamps [2] and lift the board out of the bracket.

Figure 4-3

4.4 Rear Cover Mounting

Before you mount the rear cover:

- Place the mains cord correctly in its guiding brackets (strain relief).
- 2. Place all cables in their original position.

5. Service Modes, Error Codes and Fault Finding

Index of this chapter:

- 1. Test points.
- 2. Service Modes.
- 3. Problems and Solving Tips (related to CSM).
- 4. ComPair.
- 5. Error Codes.
- 6. The Blinking LED Procedure.
- 7. Protections.
- 8. Repair Tips.

5.1 Test Points

The chassis is equipped with test points printed on the circuit board assemblies. These test points refer to the functional blocks:

TES	TEST POINT OVERVIEW L01						
Test point	Circuit	Diagram					
A1-A2-A3	Audio processing	A8, A9 / A11					
C1-C2-C3	Control	A7					
F1-F2-F3	Frame drive	A3					
l1-l2-l3	Tuner & IF	A4					
L1-L2-L3	Line drive	A2					
P1-P2-P3	Power supply	A1					
S1-S2-S3	Synchronisation	A6					
V1-V2-V3	Video processing	A5, B1					

CL 16532008_044.ep

Figure 5-1

The numbering is in a logical sequence for diagnostics. Always start diagnosing within a functional block in the sequence of the relevant test points for that block.

Perform measurements under the following conditions:

- Service Default Mode.
- Video: colour bar signal.
- Audio: 3 kHz left, 1 kHz right.

5.2 Service Modes

Service Default Mode (SDM) and Service Alignment Mode (SAM) offer several features for the service technician, while the Customer Service Menu (CSM) is used for communication between dealer and customer.

There is also the option of using ComPair, a hardware interface between a computer (see requirements) and the TV chassis. It offers the ability of structured trouble shooting, error code reading and software version readout for all L01 chassis. *Minimum requirements*: a 486 processor, Windows 3.1 and a CD-ROM drive. A Pentium Processor and Windows 95/98 are also acceptable (see also paragraph 5.4).

SW cluster	SW name	UOC-type	Diversity	Remark
2EU0	L01ET0 x.y	TDA9555	West Europe, 1 page TXT	All Service Modes
2EU9	L01ET9 x.y	TDA9555	East Europe, 1 page TXT	All Service Modes
3EU1	L01EF1 x.y	TDA9565	West Europe, 10 page TXT	All Service Modes
3EU2	L01EF2 x.y	TDA9563	East Europe, 10 page TXT	All Service Modes
Abbrevia	tions: E= Europe	, F= Full TXT, N	l= mono, T= 1 pa	ge TXT

CL 16532008_045.eps 210501

Figure 5-2

5.2.1 Service Default Mode (SDM)

Purpose

- To create a predefined setting to get the same measurement results as given in this manual.
- · To override SW protections.
- To start the blinking LED procedure.

Specifications

- Tuning frequency:
 - 475.25 MHz for PAL/SECAM (Europe and AP-PAL).
 - 61.25 MHz (channel 3) for NTSC-sets (NAFTA, LATAM and AP-NTSC).
- · Colour system:
 - PAL-M for LATAM BI/TRI/FOUR-NORMA.
 - SECAM L for France.
 - NTSC for NAFTA and AP-NTSC.
 - PAL-BG for Europe and AP-PAL.
- All picture settings at 50 % (brightness, colour contrast, hue).
- Bass, treble and balance at 50 %; volume at 25 %.
- All service-unfriendly modes (if present) are disabled, like:
 - (sleep) timer,
 - child/parental lock,
 - blue mute,
 - hotel/hospitality mode
 - auto switch-off (when no 'IDENT' video signal is received for 15 minutes),
 - skip / blank of non-favorite presets / channels,
 - auto store of personal presets,
 - auto user menu time-out.

How to enter SDM

Use one of the following methods:

- Use a standard customer RC-transmitter and key in the code '062596' directly followed by the MENU button or
- Short wires 9631 and 9641 on the mono carrier (see Fig. 81) and apply Mains power. Then press the power button
 (remove the short after start-up). Caution: Entering SDM
 by shorten wires 9631 and 9641 will override the +8Vprotection. Do this only for a short period. When doing this,
 the service-technician must know exactly what he is doing,
 as it could lead to damaging the set.
- · Or via ComPair.

L01.1E AB

CL 16532020_060.pdf 220501

Figure 5-3

How to navigate

Use one of the following methods:

- When you press the MENU button on the remote control, the set will switch between the SDM and the normal user menu (with the SDM mode still active in the background). Return to the SDM screen with the OSD / STATUS button.
- When you press the OSD / STATUS button on the remote control, the menu will show or hide the error buffer. This feature is available to prevent interference during waveform measurements.
- On the TV, press and hold the 'VOLUME down' and press the 'CHANNEL down' for a few seconds, to switch from SDM to SAM and reverse.

How to exit

Switch the set to STANDBY by pressing the power button on the remote control transmitter (if you switch the set 'off' by removing the Mains power, the set will return in SDM when Mains power is re-applied). The error buffer is cleared.

Service Alignment Mode (SAM)

Purpose

- To perform alignments.
- To change option settings.
- To display / clear the error code buffer.

Specifications

- Operation hours counter.
- Software version.
- Option settings.
- Error buffer reading and erasing.
- Software alignments.

How to enter

Use one of the following methods:

- Use a standard customer RC-transmitter and key in the code '062596' directly followed by the OSD / STATUS
- Via ComPair.

The following screen is visible, with SAM at the upper right side for recognition.

Figure 5-4

- 1. LLLL This is the operation hours counter. It counts the normal operation hours, not the standby hours.
- 2. AAABCD-X.Y This is the software identification of the main micro controller:
 - A =the project name (L01).
 - B = the region: E = Europe, A = Asia Pacific, U = NAFTA, L = LATAM.
 - C = the software diversity: D= DVD, F= full TXT, M= mono, T= 1 page TXT.
 - D = the language cluster number.
 - X = the main software version number.
 - Y = the sub software version number.
- 3. SAM Indication of the actual mode.
- 4. Error buffer Five errors possible.
- 5. Option bytes Seven codes possible.
- Clear Erase the contents of the error buffer. Select the CLEAR menu item and press the CURSOR RIGHT key. The content of the error buffer is cleared.
- 7. Options To set the Option Bytes. See chapter 8.3.1 for a detailed description.
- AKB Disable (0) or enable (1) the 'black current loop' (AKB = Auto Kine Bias).
- Tuner To align the Tuner. See chapter 8.3.2 for a detailed description.
- 10. White Tone To align the White Tone. See chapter 8.3.3 for a detailed description.
- 11. Geometry To align the Geometry. See chapter 8.3.4 for a detailed description.
- 12. Audio To align the Audio. See chapter 8.3.5 for a detailed description.

How to navigate

Use one of the following methods:

- In SAM, select menu items with the CURSOR UP/DOWN key on the remote control transmitter. The selected item will be highlighted. When not all menu items fit on the screen, move the CURSOR UP/DOWN key to display the next / previous menu items.
- With the CURSOR LEFT/RIGHT keys, it is possible to:
 - (De)activate the selected menu item.
 - Change the value of the selected menu item.

- Activate the selected submenu.
- When you press the MENU button twice, the set will switch
 to the normal user menus (with the SAM mode still active
 in the background). To return to the SAM menu press the
 OSD / STATUS button [i+].
- When you press the MENU key in a submenu, you will return to the previous menu.

How to exit

Switch the set to STANDBY by pressing the power button on the remote control (if you switch the set 'off' by removing the Mains power, the set will return in SAM when Mains power is re-applied). The error buffer is **not** cleared.

5.2.3 Customer Service Mode (CSM)

Purpose

When a customer is having problems with his TV-set, he can call his dealer. The service technician can than ask the customer to activate the CSM, in order to identify the status of the set. Now, the service technician can judge the severness of the complaint. In a lot of cases he can advise the customer how to solve the problem, or he can decide if it is necessary to visit the customer.

The CSM is a read only mode, therefore modifications in this mode are not possible.

How to enter

The CSM will be turned on after pressing the MUTE key on the remote control transmitter and any of the control buttons on the TV for at least 4 seconds **simultaneously**. This activation only works if there is no menu on the screen.

After switching ON the Customer Service Mode, the following screen will appear:

1 AAABCD X.Y
2 CODES XX XX XX XX XX XX
3 OP XXX XXX XXX XXX XXX XXX XXX
4 DETECTED SYSTEM DETECTED SOUND
5 NOT TUNED SKIPPED
6 TIMER
7
8 CO XX CL XX BR XX HU XX SH XX
9 VL XX BL XX AVL
10 TR XX BS XX

CL 16532008_046.ep

Figure 5-5

- Software identification of the main micro controller (see paragraph 5.2.2 for an explanation).
- Error code buffer (see paragraph 5.5 for more details).Displays the last seven errors of the error code buffer.
- In this line, the Option Bytes (OB) are visible. Each Option Byte is displayed as a decimal number between 0 and 255.
 The set may not work correctly when an incorrect option code is set. See chapter 8.3.1 for more information on the option settings.
- Indicates which color and sound system is installed for the selected pre-set.
- 5. Indicates if the set is not receiving an 'IDENT' signal on the selected source. It will display 'Not Tuned'.
- 6. Indicates if the sleep timer is enabled.
- 7. Indicates if the V-chip feature is enabled.
- 8. Value indicates parameter levels at CSM entry. CO= CONTRAST, CL= COLOR, BR= BRIGHTNESS, HU= HUE, SH= SHARPNESS
- Value indicates parameter levels at CSM entry. VL= VOLUME LEVEL, BL= BALANCE LEVEL, AVL= AUTO VOLUME LEVEL LIMITER, DV= DELTA VOLUME

 Value indicates parameter levels at CSM entry (only for stereo sets). TR= TREBLE, BS= BASS

How to exit

Use one of the following methods:

- After you press 'any' key of the remote control transmitter with exception of the CHANNEL and VOLUME keys.
- After you switch-off the TV set with the Mains power switch.

5.3 Problems and Solving Tips (Related To CSM)

5.3.1 Picture Problems

Note: Below described problems are all related to the TV settings. The procedures to change the value (or status) of the different settings are described.

No colours / noise in picture

Check CSM line 4. Wrong colour system installed. To change the setting:

- 1. Press the MENU button on the remote control.
- 2. Select the INSTALL sub menu.
- 3. Select the MANUAL STORE sub menu.
- Select and change the SYSTEM setting until picture and sound are correct.
- 5. Select the STORE menu item.

Colours not correct / unstable picture

Check CSM line 4. Wrong colour system installed. To change the setting:

- 1. Press the MENU button on the remote control.
- Select the INSTALL sub menu.
- 3. Select the MANUAL STORE sub menu.
- Select and change the SYSTEM setting until picture and sound are correct.
- 5. Select the STORE menu item.

TV switches 'off' (or 'on') or changes the channel without any user action

(Sleep)timer switched the set 'off' or changed channel. To change the setting:

- Press the MENU button on the remote control.
- 2. Select the FEATURES sub menu.
- 3. Select the TIMER sub menu.
- 4. Select and change the SLEEP or TIME setting.

Picture too dark or too bright

Increase / decrease the BRIGHTNESS and / or the CONTRAST value when:

- The picture improves after you have pressed the 'Smart Picture' button on the remote control.
- The picture improves after you have switched on the Customer Service Mode

The new 'Personal' preference value is automatically stored.

White line around picture elements and text

Decrease the SHARPNESS value when:

- The picture improves after you have pressed the 'Smart Picture' button on the remote control.
- The picture improves after you have switched on the Customer Service Mode

The new 'Personal' preference value is automatically stored.

Snowy picture

Check CSM line 5. If this line indicates 'Not Tuned', check the following:

- No or bad antenna signal. Connect a proper antenna signal.
- Antenna not connected. Connect the antenna.
- No channel / pre-set is stored at this program number. Go to the INSTALL menu and store a proper channel at this program number.

The tuner is faulty (in this case the CODES line will contain error number 10). Check the tuner and replace / repair if necessary.

L01.1E AB

Snowy picture and/or unstable picture

A scrambled or decoded signal is received.

Black and white picture

Increase the COLOR value when:

- The picture improves after you have pressed the 'Smart Picture' button on the remote control.
- The picture improves after you have switched on the Customer Service Mode

The new 'Personal' preference value is automatically stored.

Menu text not sharp enough

Decrease the CONTRAST value when:

- The picture improves after you have pressed the 'Smart Picture' button on the remote control.
- The picture improves after you have switched on the Customer Service Mode

The new 'Personal' preference value is automatically stored.

Sound Problems

No sound or sound too loud (after channel change / switching on)

Increase / decrease the VOLUME level when the volume is OK after you switched on the CSM. The new 'Personal' preference value is automatically stored.

5 4 ComPair

Introduction 541

ComPair (Computer Aided Repair) is a service tool for Philips Consumer Electronics products. ComPair is a further development on the European DST (service remote control), which allows faster and more accurate diagnostics. ComPair has three big advantages:

- ComPair helps you to quickly get an understanding on how to repair the chassis in a short time by guiding you systematically through the repair procedures.
- ComPair allows very detailed diagnostics (on I2C level) and is therefore capable of accurately indicating problem areas. You do not have to know anything about I²C commands yourself because ComPair takes care of this.
- ComPair speeds up the repair time since it can automatically communicate with the chassis (when the microprocessor is working) and all repair information is directly available. When ComPair is installed together with the SearchMan electronic manual of the defective chassis, schematics and PWBs are only a mouse click away.

5.4.2 Specifications

ComPair consists of a Windows based faultfinding program and an interface box between PC and the (defective) product. The ComPair interface box is connected to the PC via a serial or RS232 cable.

In case of the L01 chassis, the ComPair interface box and the TV communicate via a bi-directional service cable via the service connector (located on the Main panel, see also figure 8-1 suffix D).

The ComPair faultfinding program is able to determine the problem of the defective television. ComPair can gather diagnostic information in two ways:

Automatic (by communication with the television): ComPair can automatically read out the contents of the entire error buffer. Diagnosis is done on I²C level. ComPair can access the I2C bus of the television. ComPair can send and

- receive I2C commands to the micro controller of the television. In this way, it is possible for ComPair to communicate (read and write) to devices on the I2C busses of the TV-set.
- Manually (by asking questions to you): Automatic diagnosis is only possible if the micro controller of the television is working correctly and only to a certain extend. When this is not the case, ComPair will guide you through the faultfinding tree by asking you questions (e.g. Does the screen gives a picture? Click on the correct answer: YES / NO) and showing you examples (e.g. Measure test-point I7 and click on the correct oscillogram you see on the oscilloscope). You can answer by clicking on a link (e.g. text or a waveform picture) that will bring you to the next step in the faultfinding process.

By a combination of automatic diagnostics and an interactive question / answer procedure, ComPair will enable you to find most problems in a fast and effective way.

Beside fault finding, ComPair provides some additional features like:

- Up- or downloading of pre-sets.
- Managing of pre-set lists.
- Emulation of the (European) Dealer Service Tool (DST).
- If both ComPair and SearchMan (Electronic Service Manual) are installed, all the schematics and the PWBs of the set are available by clicking on the appropriate hyperlink. Example: Measure the DC-voltage on capacitor C2568 (Schematic/Panel) at the Monocarrier. Click on the 'Panel' hyperlink to automatically show the PWB with a highlighted capacitor C2568. Click on the 'Schematic' hyperlink to automatically show the position of the highlighted capacitor.

5.4.3 How To Connect

- 1. First install the ComPair Browser software (see the Quick Reference Card for installation instructions).
- 2. Connect the RS232 interface cable between a free serial (COM) port of your PC and the PC connector (marked with 'PC') of the ComPair interface.
- 3. Connect the Mains power adapter to the supply connector (marked with 'POWER 9V DC') on the ComPair interface.
- Switch the ComPair interface OFF.
- Switch the television set OFF (remove the Mains power).
- Connect the ComPair interface cable between the connector on the rear side of the ComPair interface (marked with 'I2C') and the ComPair connector on the mono carrier (see figure 8-1 suffix D).
- 7. Plug the Mains power adapter in the Mains power outlet and switch on the interface. The green and red LEDs light up together. The red LED extinguishes after approx. 1 second while the green LED remains lit.
- Start the ComPair program and read the 'introduction' chapter.

Figure 5-6

How To Order

ComPair order codes:

- Starter kit ComPair + SearchMan software + ComPair interface (excluding transformer): 4822 727 21629
- ComPair interface (excluding transformer): 4822 727 21631
- Starter kit ComPair software (registration version): 4822 727 21634
- Starter kit SearchMan software: 4822 727 21635
- ComPair CD (update): 4822 727 21637
 SearchMan CD (update): 4822 727 21638
 ComPair interface cable: 3122 785 90004

5.5 Error Buffer

The error code buffer contains all detected errors since the last time the buffer was erased. The buffer is written from left to right. When an error occurs that is not yet in the error code buffer, it is written at the left side and all other errors shift one position to the right.

5.5.1 How to Read the Error Buffer

Use one of the following methods:

- On screen via the SAM (only if you have a picture).
 Examples:
 - ERROR: 0 0 0 0 0: No errors detected
 - ERROR: 6 0 0 0 0: Error code 6 is the last and only detected error
 - ERROR: 9 6 0 0 0: Error code 6 was first detected and error code 9 is the last detected (newest) error
- Via the blinking LED procedure (when you have no picture). See next paragraph.

· Via ComPair.

5.5.2 How to Clear the Error Buffer

The error code buffer is cleared in the following cases:

- By activation of the CLEAR command in the SAM menu:
- When you exit SDM / SAM with the STANDBY command on the remote control (when leaving SDM / SAM, by disconnecting the set from Mains power, the error buffer is not reset).
- When you transmit the command DIAGNOSE-99-OK with ComPair.
- If the content of the error buffer has not changed for 50 hours, it resets automatically.

5.5.3 Error Codes

In case of non-intermittent faults, clear the error buffer before you begin the repair. These to ensure that old error codes are no longer present.

If possible, check the entire contents of the error buffer. In some situations, an error code is only the result of another error code and not the actual cause (e.g., a fault in the protection detection circuitry can also lead to a protection).

	ERROR CODE TABLE									
Error	Device	Error description	Def. item	Diagram						
0	Not applicable No Error									
1	Not applicable	X-Ray/overvoltage protection (USA only)	2465, 7460	A2						
2	Not applicable	Horizontal protection	7460, 7461, 7462, 7463, 6467	A2						
	TDA8359/TDA9302	Vertical protection	7861, VlotAux+13V	A2, A3						
3	Reserve									
4	MSP34X5 / TDA9853	MSP I ² C identification error	7831 or 7861	A9 or A11						
5	TDA95xx	POR 3V3 / +8V protection	OR 3V3 / +8V protection 7200, 7560, 7480							
6	I ² C bus	General I ² C bus error	7200, 3624, 3625	A7						
7	AN7522/3	Power down (over current) protection	7901 / 7902, 7561	A8, A1						
8	Not applicable	E/W protection (Large Screen)	7400, 3405, 3406, 3400	A2						
9	M24C08	NVM I ² C identification error	7602, 3611, 3603/04	A7

11	TDA6107/8	Black current loop protection	7330, RGB amps, CRT	B1, B2						
12	M65669	PIP I ² C identification error	7803	Р						

CL 16532008_047.pdf 210501

5.6 The Blinking LED Procedure

Via this procedure, you can make the contents of the error buffer visible via the front LED. This is especially useful when there is no picture.

L01.1E AB

When the SDM is entered, the LED will blink the contents of the error-buffer

Error-codes ≥ 10 are shown as follows:

- a long blink of 750 ms (which is an indication of the decimal diait).
- a pause of 1.5 s,
- n short blinks (n = 1 9).
- when all the error-codes are displayed, the sequence finishes with a LED blink of 3 s,
- the sequence starts again.

Example of error buffer: 12 9 6 0 0 After entering SDM:

- 1 long blink of 750 ms followed by a pause of 1.5 s,
- 2 short blinks followed by a pause of 3 s,
- 9 short blinks followed by a pause of 3 s,
- 6 short blinks followed by a pause of 3 s,
- 1 long blink of 3 s to finish the sequence,
- the sequence starts again.

5.7 **Protections**

If a fault situation is detected an error code will be generated and if necessary, the set will be put in the protection mode. Blinking of the red LED at a frequency of 3 Hz indicates the protection mode. In some error cases, the microprocessor does not put the set in the protection mode. The error codes of the error buffer can be read via the service menu (SAM), the blinking LED procedure or via ComPair. The DST diagnose functionality will force the set into the Service-standby, which is similar to the usual standby mode, however the microprocessor has to remain in normal operation completely.

To get a quick diagnosis the chassis has three service modes implemented:

- The Customer Service Mode (CSM).
- The Service Default Mode (SDM). Start-up of the set in a predefined way.
- The Service Alignment Mode (SAM). Adjustment of the set via a menu and with the help of test patterns.

See for a detailed description Chapter 9 paragraphs Deflection and Power Supply.

5.8 **Repair Tips**

Below some failure symptoms are given, followed by a repair tip.

- Set is dead and makes hiccuping sound 'MainSupply' is available. Hiccuping stops when desoldering L5561, meaning that problem is in the 'MainSupply' load. No output voltages at LOT, no horizontal deflection. Reason: line transistor 7460 is defective.
- Set is dead, and makes no sound

Check power supply IC7520. Result: voltage at pins 1, 3, 4, 5 and 6 are about 180 V and pin 8 is 0 V. The reason why the voltage on these pins is so high is because the output driver (pin 6) has an open load. That is why MOSFET TS7521 is not able to switch. Reason: feedback resistor 3523 is defective.

Caution: be careful measuring on the gate of TS7521; circuitry is very high ohmic and can easily be damaged! (first connect ground to measuring equipment, than the gate).

Set is in hiccup mode and shuts down after 8 s.

Blinking LED (set in SDM mode) indicates error 5. As it is unlikely that μP 'POR' and '+8V protection' happen at the same time, measure the '+8V'. If this voltage is missing, check transistor TS7480.

Set is non-stop in hiccup mode

Set is in over current mode; check the secondary sensing (opto coupler 7515) and the 'MainSupply' voltage. Signal 'Stdby_con' must be logic low under normal operation conditions and goes to high (3.3 V) under standby and fault conditions.

Set turns on, but without picture and sound The screen shows snow, but OSD and other menus are okay. Blinking LED procedure indicates error 10, so problem is expected in the tuner (pos. 1000). Check

presence of supply voltages. As 'Vlotaux+5V' at pin 6 and 7 are okay, 'VT_supply' at pin 9 is missing. Conclusion: resistor 3460 or 3488 is defective.

Set turns on, but with a half screen at the bottom. Sound is okay

Blinking LED (set in SDM mode) indicates error 2. Check 'Vlotaux+13V' and '+50V'. If they are okay, problem is expected in the vertical amplifier IC7471. Measure with a scope the waveform on pin 17 of the UOC. Measure also at pin 1 of IC7471. If here the signal is missing, a defective resistor R3244 causes the problem.

8. Alignments

Index of this chapter:

- 1. General Alignment Conditions
- 2. Hardware Alignments
- 3. Software Alignments and Settings

Note: The Service Default Mode (SDM) and Service Alignment Mode (SAM) are described in chapter 5. Menu navigation is done with the 'CURSOR UP, DOWN, LEFT or RIGHT' keys of the remote control transmitter.

8.1 General Alignment Conditions

Perform all electrical adjustments under the following conditions:

- Mains voltage and frequency: according to country's standard.
- · Connect the set to the Mains via an isolation transformer.
- · Allow the set to warm up for approximately 20 minutes.
- Measure the voltages and waveforms in relation to chassis ground (with the exception of the voltages on the primary side of the power supply). Never use the cooling fins/plates as ground.
- Test probe: Ri > 10 MΩ; Ci < 2.5 pF.
- Use an isolated trimmer/screwdriver to perform the alignments.

8.2 Hardware Alignments

Figure 8-1

8.2.1 Vg2 Adjustment

- 1. Activate the SAM.
- 2. Go to the WHITE TONE sub menu.
- 3. Set the values of NORMAL RED, GREEN and BLUE to 40.
- 4. Go, via the MENU key, to the normal user menu and set
 - CONTRAST to zero.

- BRIGHTNESS to minimum (OSD just visible in a dark room).
- 5. Return to the SAM via the MENU key.
- Connect the RF output of a pattern generator to the antenna input. Test pattern is a 'black' picture (blank screen on CRT without any OSD info).
- 7. Set the channel of the oscilloscope to 50 V/div and the time base to 0.2 ms (external triggering on the vertical pulse).
- Ground the scope at the CRT panel and connect a 10:1 probe to one of the cathodes of the picture tube socket (see diagram B).
- Measure the cut off pulse during first full line after the frame blanking (see Fig. 8-2). You will see two pulses, one being the cut off pulse and the other being the white drive pulse. Choose the one with the lowest value, this is the cut off pulse.
- Select the cathode with the highest V_{DC} value for the alignment. Adjust the V_{cutoff} of this gun with the SCREEN potentiometer (see Fig. 8-1) on the LOT to the correct value (see table below).
- 11. Restore BRIGHTNESS and CONTRAST to normal (= 31).

Figure 8-2

CUT-OFF VOLTAGE	
Screen size	Cut-off [V]
13V, 14 , 14RF, 15RF, 17 , 19V, 20	140 4
21 (L01S)	150 4
21 (L01L), 20RF, 21RF, 24WS,	125 4
25BLD, 25HF, 28 BLD, 28WS	
25V, 25BLS, 25RF, 27V, 28BLS, 29 ,	145 10
29RF, 32V, 33 , 32WS, 35V	
	CL 16532008_056.p

Figure 8-3

8.2.2 Focusing

- Tune the set to a circle or crosshatch test pattern (use an external video pattern generator).
- Choose picture mode NATURAL (or MOVIES) with the 'SMART PICTURE' button on the remote control transmitter.
- Adjust the FOCUS potentiometer (see Fig. 8-1) until the vertical lines at 2/3 from east and west, at the height of the centreline, are of minimum width without visible haze.

8.3 Software Alignments and Settings

Enter the Service Alignment Mode (see chapter 5). The SAM menu will now appear on the screen.

Select one of the following alignments:

- 1. Options
- 2. Tuner
- 3. White Tone
- 4. Geometry
- 5. Audio

8.3.1 Options

Figure 8-4

Options are used to control the presence/absence of certain features and hardware.

How to change an Option Byte

An Option Byte represents a number of different options. Changing these bytes directly makes it possible to set all options very fast. All options are controlled via seven option bytes. Select the option byte (OB1.. OB7) with the MENU UP/DOWN keys, and enter the new value.

Leaving the OPTION submenu saves changes in the Option Byte settings. Some changes will only take effect after the set has been switched OFF and ON with the Mains switch (cold start).

How to calculate the value of an Option Byte

Calculate an Option Byte value (OB1 .. OB7) in the following way:

- 1. Check the status of the single option bits (OP): are they enabled (1) or disabled (0).
- When an option bit is enabled (1) it represents a certain value (see first column 'value between brackets' in first table below). When an option bit is disabled, its value is 0.
- The total value of an Option Byte is formed by the sum of its eight option bits. See second table below for the correct option numbers per typenumber.

Bit	OB1	OB2	OB3	OB4	OB5	OB6	OB7
(value)							
0 (1)	OP10	OP20	OP30	OP40	OP50	OP60	OP70
1 (2)	OP11	OP21	OP31	OP41	OP51	OP61	OP71
2 (4)	OP12	OP22	OP32	OP42	OP52	OP62	OP72
3 (8)	OP13	OP23	OP33	OP43	OP53	OP63	OP73
4 (16)	OP14	OP24	OP34	OP44	OP54	OP64	OP74
5 (32)	OP15	OP25	OP35	OP45	OP55	OP65	OP75
6 (64)	OP16	OP26	OP36	OP46	OP56	OP66	OP76
7 (128)	OP17	OP27	OP37	OP47	OP57	OP67	OP77

Option Bit Assignment

82PW6216/18

Following are the option bit assignments for all L01 software clusters.

- Option Byte 1 (OB1)
 - OP10: CHINA
 - OP11: VIRGIN_MODE

28

- OP12: UK_PNP
- OP13: ACI
- OP14: ATS
- OP15: LNA
- OP16: FM_RADIO
- OP17: PHILIPS_TUNER
- Option Byte 2 (OB2)
 - OP20: HUE
 - OP21: COLOR_TEMP
 - OP22: CONTRAST_PLUS
 - OP23: TILT

- OP24: NOISE_REDUCTION
- OP25: CHANNEL_NAMING
- OP26: SMART_PICTURE
- OP27: SMART_SOUND

Option Byte 3 (OB3)

- OP30: AVL
- OP31: WSSB
- OP32: WIDE_SCREEN
- OP33: SHIFT_HEADER_SUBTITLE
- OP34: CONTINUOUS_ZOOM
- OP35: COMPRESS_16_9
- OP36: EXPAND_4_3
- OP37: EW_FUNCTION

Option Byte 4 (OB4)

- OP40: STEREO_NON_DBX
- OP41: STEREO_DBX
- OP42: STEREO_PB
- OP43: STEREO_NICAM_2CS
- OP44: DELTA VOLUME
- OP45: ULTRA_BASS
- OP46: VOLUME_LIMITER
- OP47: INCR_SUR

Option Byte 5 (OB5)

- OP50: PIP
- OP51: HOTEL_MODE
- OP52: SVHS
- OP53: CVI
- OP54: AV3
- OP55: AV2
- OP56: AV1
- OP57: NTSC_PLAYBACK

Option Byte 6 (OB6)

- OP60: Reserved (value = 0)
- OP61: SMART_TEXT
- OP62: SMART_LOCK
- OP63: VCHIP
- OP64: WAKEUP_CLOCK
- OP65: SMART_CLOCK
- OP66: SMART_SURF
- OP67: PERSONAL_ZAPPING

Option Byte 7 (OB7)

- OP70: SOUND SYSTEM AP 3/
 - MULTI_STANDARD_EUR/SYSTEM_LT_2
- OP71: SOUND_SYSTEM_AP_2/WEST_EU/
 - SYSTEM_LT_1
- OP72: SOUND_SYSTEM_AP_1
- OP73: COLOR_SYSTEM_AP
- OP74: Reserved (value = 0)
- OP75: Reserved (value = 0)
- OP76: TIME_WIN2
- OP77: TIME_WIN1

Option bit definition

OP10: CHINA

0: Tuning is not for China set, or this option bit is not applicable,

1: Tuning is for China set,

Default setting: 0.

OP11: VIRGIN_MODE

- 0 : Virgin mode is disabled or not applicable,
- 1: Virgin mode is enabled. Plug and Play menu item will be displayed to perform installation at the initial start-up of the TV when VIRGIN_MODE is set to 1. After installation is finished, this option bit will be automatically set to 0,

Default setting: 0.

OP12: UK_PNP

- 0: UK's default Plug and Play setting is not available or not applicable,
- 1 : UK's default Plug and Play setting is available. When UK_PNP and VIRGIN_MODE are set to 1 at the initial set-up, LANGUAGE = ENGLISH, COUNTRY = GREAT BRITAIN and after exiting from menu, VIRGIN_MODE will be set automatically to 0 while UK_PNP remains 1,

Default setting: 0.

OP13: ACI

- 0: ACI feature is disabled or not applicable,
- 1 : ACI feature is enabled,

Default setting: 0.

OP14: ATS

- 0: ATS feature is disabled or not applicable,
- 1 : ATS feature is enabled. When ATS is enabled, it sorts the program in an ascending order starting from program 1, Default setting : 0.

OP15: LNA

0 : Auto Picture Booster is not available or not applicable,

1 : Auto Picture Booster is available,

Default setting: 0.

OP16: FM RADIO

- 0: FM radio feature is disabled or not applicable,
- 1: FM radio feature is enabled,

Default setting: 0.

OP17: PHILIPS_TUNER

- 0: ALPS/MASCO compatible tuner is in use,
- 1 : Philips compatible tuner is in use,

Default setting: 0.

OP20: HUE

- 0: Hue/Tint Level is disabled or not applicable,
- 1: Hue/Tint Level is enabled,

Default setting: 0.

OP21: COLOR_TEMP

- 0 : Colour Temperature is disabled or not applicable,
- 1 : Colour Temperature is enabled,

Default setting: 0.

OP22: CONTRAST_PLUS

- 0 : Contrast+ is disabled or not applicable,
- 1 : Contrast+ is enabled,

Default setting: 0.

OP23: TILT

- 0 : Rotate Picture is disabled or not applicable,
- 1 : Rotate Picture is enabled,

Default setting: 0.

OP24: NOISE_REDUCTION

- 0 : Noise Reduction (NR) is disabled or not applicable,
- 1 : Noise Reduction (NR) is enabled,

Default setting : 0.

OP25: CHANNEL_NAMING

- 0 : Name FM Channel is disabled or not applicable,
- 1: Name FM Channel is enabled,

Default setting: 0.

Note: Name FM channel can be enabled only when FM_RADIO = 1.

OP26: SMART_PICTURE

- 0 : Smart Picture is disabled or not applicable,
- 1 : Smart Picture is enabled,

Default setting: 1

OP27: SMART_SOUND

- 0 : Smart Sound is disabled or not applicable,
- 1 : Smart Sound is enabled,

Default setting: 1

AP30: AVL

0: AVL is disabled or not applicable,

1 : AVL is enabled, Default setting : 0.

OP31: WSSB

0: WSSB is disabled or not applicable,

1: WSSB is enabled,

Default setting : 0. Note: This option bit can be set to 1 only when $WIDE_SCREEN = 1$.

OP32: WIDE_SCREEN

0 : Software is used for 4:3 set or not applicable,

1: Software is used for 16:9 set,

Default setting: 0.

OP33: SHIFT_HEADER_SUBTITLE

0: Shift Header/Subtitle is disabled or not applicable,

1 : Shift Header/Subtitle is enabled,

Default setting: 0. **Note:** This option bit can be set to 1 only when WIDE_SCREEN = 1.

OP34: CONTINUOUS_ZOOM

0: Continuous Zoom is disabled or not applicable,

1: Continuous Zoom is enabled,

Default setting : 0. Note: This option bit can be set to 1 only when $WIDE_SCREEN = 1$.

OP35: COMPRESS_16_9

0 : COMPRESS 16:9 selection is not applicable. Item should not be in the FORMAT menu list,

1: COMPRESS 16:9 selection is applicable. Item should not be in the FORMAT menu list,

Default setting: 0.

OP36: EXPAND_4_3

 $\bf 0$: Expand 4:3 selection is not applicable. Item should not be in the FORMAT menu list,

1 : Expand 4:3 selection is applicable. Item should be in the FORMAT menu list,

Default setting: 0.

OP37: EW_FUNCTION

0: EW function is disabled. In this case, only Expand 4:3 is allowed, Compress 16:9 is not applicable.

1: EW function is enabled. In this case, both Expand 4:3 and Compress 16:9 are applicable.

Default setting: 0.

OP40: STEREO_NON_DBX

0 : For AP_NTSC, chip TDA 9853 is not present,

1 : For AP_NTSC, chip TDA 9853 is present,

Default setting: 0.

OP41: STEREO_DBX

0 : For AP_NTSC, chip MSP 3445 is not present,

1 : For AP_NTSC, chip MSP 3445 is present,

Default setting: 0.

OP42: STEREO_PB

0 : For AP_PAL, chip MSP3465 is not present,

 $1: \mbox{For AP_PAL}, \mbox{chip MSP3465} \mbox{ is present,}$

Default setting: 0.

OP43: STEREO_NICAM_2CS

 $\mathbf{0}$: For EU and AP_PAL, chip MSP 3415 is not present,

1 : For EU and AP_PAL, chip MSP 3415 is present,

Default setting: 0.

OP44: DELTA_VOLUME

0 : Delta Volume Level is disabled or not applicable,

1 : Delta Volume Level is enabled,

Default setting: 0.

OP45: ULTRA_BASS

0: Ultra Bass is disabled or not applicable,

1: Ultra Bass is enabled,

Default setting: 0.

OP46: VOLUME LIMITER

0: Volume Limiter Level is disabled or not applicable,

1: Volume Limiter Level is enabled,

Default setting: 0.

OP47: INCR SUR

0: Incredible Surround feature is disabled,

1: Incredible Surround feature is enabled,

Default setting: 1

OP50: PIP

0 : PIP is disabled or not applicable,

1 : PIP is enabled, Default setting : 0.

OP51: HOTEL_MODE

0: Hotel mode is disabled or not applicable,

1: Hotel mode is enabled,

Default setting: 0.

OP52: SVHS

0: SVHS source is not available,

1: SVHS source is available,

Default setting: 0.

Note: This option bit is not applicable for EU.

OP53: CVI

0: CVI source is not available,

1: CVI source is available,

Default setting: 0.

OP54: AV3

0: Side/Front AV3 source is not present,

1 : Side/Front AV3 source is present,

Default setting : 0.

OP55: AV2

0 : AV2 source is not present,

1 : AV2 source is present,

Default setting: 0.

Note: For EU, when AV2=1, both EXT2 and SVHS2 should be included in the OSD loop.

OP56: AV1

0: AV1 source is not present,

1: AV1 source is present,

Default setting: 0.

OP57: NTSC_PLAYBACK

0: NTSC playback feature is not available,

1 : NTSC playback feature is available,

Default setting: 0.

OP60: Reserved Default setting : 0.

OP61: SMART_TEXT

0 : Smart Text Mode and Favourite Page are disabled or not applicable,

1 : Smart Text Mode and Favourite Page are enabled, Default setting : 1.

OP62: SMART LOCK

 $\mathbf{0}$: Child Lock and Lock Channel are disabled or not applicable for EU.

1: Child Lock and Lock Channel are enabled for EU,

Default setting: 1.

OP63: VCHIP

0: VCHIP feature is disabled,

1: VCHIP feature is enabled,

Default setting: 1.

OP64: WAKEUP_CLOCK

0: Wake up clock feature is disabled or not applicable,

1: Wake up clock feature is enabled,

Default setting: 1.

OP65: SMART_CLOCK

0 : Smart Clock Using Teletext and Smart Clock Using PBS is disabled or not applicable,

1: Smart Clock Using Teletext and Smart Clock Using PBS is enabled. For NAFTA, menu item AUTOCHRON is present in the INSTALL submenu,

Default setting: 0.

OP66: SMART_SURF

0 : Smart Surf feature is disabled or not applicable,

1: Smart Surf feature is enabled,

Default setting: 0.

OP67: PERSONAL_ZAPPING

0 : Personal Zapping feature is disabled or not applicable,

1 : Personal Zapping feature is enabled,

Default setting: 0.

OP70: MULTI_STANDARD_EUR

 $\boldsymbol{0}$: Not for Europe multi standard set, or this option bit is not applicable,

1 : For Europe multi standard set.

Default setting: 0.

Note: This option bit is used to control the SYSTEM selection in Manual Store: If MULTI_STANDARD_EUR = 1 then SYSTEM = Europe, West Europe, East Europe, UK, France otherwise SYSTEM = 'Europe, West Europe, UK for West Europe' (WEST_EU=1) or SYSTEM = 'Europe, West Europe, East Europe for East Europe' (WEST_EU=0)

OP71: WEST_EU

 $\ensuremath{\mathbf{0}}$: For East Europe set, or this option bit is not applicable,

1 : For West Europe set, Default setting : 0.

OP71 and 70: SYSTEM_LT_1, SYSTEM_LT_2

These two option bits are allocated for LATAM system selection.

00: NTSC-M

01: NTSC-M, PAL-M

10: NTSC-M, PAL-M, PAL-N

11: NTSC-M, PAL-M, PAL-N, PAL-BG

Default setting: 00

OP70, 71 and 72: SOUND_SYSTEM_AP_1, SOUND_SYSTEM_AP_2, SOUND_SYSTEM_AP_3

These three option bits are allocated for AP_PAL sound system selection.

900 : BG 901 : BG/DK 901 : I/DK 101 : I/DK 100 : BG/I/DK/M 911 Default setting : 00

OP73: COLOR_SYSTEM_AP

This option bit is allocated for AP-PAL colour system selection. 0 : Auto, PAL 4.43, NTSC 4.43, NTSC 3.58

1 : Auto, PAL 4.43, NTSC 4.43, NTSC 3.58, SECAM

Default setting: 0

OP74: Reserved Default setting : 0.

OP75: Reserved Default setting : 0.

OP77 and 76: TIME_WIN1, TIME_WIN2

00 : The time window is set to 1.2s 01 : The time window is set to 2s 10 : The time window is set to 5s

11 : not in use Default setting : 01

Note: The time-out for all digit entries depend on this setting.

8.3.2 Tuner

Note: Described alignments are only necessary when the NVM (item 7602) is replaced.

Figure 8-7

IFPLL

This adjustment is auto-aligned. Therefore, no action is required.

Default value is 30.

AFW (AFC window)

Select the lowest value.

AGC (AGC take over point)

Set the external pattern generator to a colour bar video signal and connect the RF output to aerial input.

Set amplitude to 10 mV and set frequency to 475.25 MHz (PAL/SECAM) or 61.25 MHz (NTSC).

Connect a DC multi-meter to pin 1 of the tuner (item 1000 on the main panel).

- 1. Activate the SAM.
- 2. Go to the TUNER sub menu.
- 3. Select AFW with the UP/DOWN cursor keys and set to ON.
- 4. Select AGC with the UP/DOWN cursor keys.
- Adjust the AGC-value with the LEFT/RIGHT cursor keys until the voltage at pin 1 of the tuner lies between 3.8 and 2.3 V. Default value is 28.
- Select AFW with the UP/DOWN cursor keys and set to OFF
- 7. Switch the set to STANDBY.

YD (Y-delay adjustment)

Fixed value is 7.

CL (Cathode drive level)

Fixed value is 8.

AFA/AFB

Read only bit, for monitoring purpose only.

8.3.3 White Tone

Figure 8-8

In the WHITE TONE sub menu, the values of the black cut off level can be adjusted. Normally, no alignment is needed for the WHITE TONE. You can use the given default values. The colour temperature mode (NORMAL, COOL and WARM) and the colour (R, G, and B) can be selected with the UP/DOWN RIGHT/LEFT cursor keys. The value can be changed with the LEFT/RIGHT cursor keys. First, select the values for the NORMAL colour temperature. Then select the values for the COOL and WARM mode. After alignment, switch the set to standby, in order to store the alignments.

Default settings:

- 1. **NORMAL** (colour temperature = 10500 K):
 - NORMAL R = 26
 - NORMAL G = 32
 - NORMAL B = 27
- 2. **COOL** (colour temperature = 14000 K):
 - DELTA COOL R = -3
 - DELTA COOL G = 0
 - DELTA COOL B = 5
- 3. **WARM** (colour temperature = 8200 K):
 - DELTA WARM R = 2
 - DELTA WARM G = 0
 - DELTA WARM B = -6

8.3.4 Geometry

The geometry alignments menu contains several items to align the set, in order to obtain a correct picture geometry.

Figure 8-9

How to align

Connect an external video pattern generator to the aerial input of the TV-set and input a crosshatch test pattern. Set amplitude to at least 1 mV and set frequency to 475.25 MHz (PAL/SECAM) or 61.25 MHz (NTSC).

- 1. Set 'Smart Picture' to NATURAL (or MOVIES).
- 2. Activate the SAM menu (see chapter 5).
- 3. Go to the GEOMETRY sub menu.
- 4. Choose HORIZONTAL or VERTICAL alignment Now you can perform the following alignments:

Horizontal alignment

- Horizontal Parallelogram (HP). Align straight vertical lines in the top and the bottom; vertical rotation around the centre.
- Horizontal Bow (HB). Align straight horizontal lines in the top and the bottom; horizontal rotation around the centre.
- Horizontal Shift (HSH). Align the horizontal centre of the picture to the horizontal centre of the CRT.
- East West Width (EWW). Align the picture width until the complete test pattern is visible.
- East West Parabola (EWP). Align straight vertical lines at the sides of the screen.
- Upper Corner Parabola (UCP). Align straight vertical lines in the upper corners of the screen.

- Lower Corner Parabola (LCP). Align straight vertical lines in the lower corners of the screen.
- East West Trapezium (EWT). Align straight vertical lines in the middle of the screen.

Figure 8-10

Vertical alignment

- Vertical slope (VSL). Align the vertical centre of the picture to the vertical centre of the CRT. This is the first of the vertical alignments to perform. For an easy alignment, set SBL to ON.
- Vertical Amplitude (VAM). Align the vertical amplitude so that the complete test pattern is visible.
- Vertical S-Correction (VSC). Align the vertical linearity, meaning that vertical intervals of a grid pattern must be equal over the entire screen height.
- Vertical Shift (VSH). Align the vertical centring so that the test pattern is located vertically in the middle. Repeat the 'vertical amplitude' alignment if necessary.
- Vertical Zoom (VX). The vertical zoom is added in for the purpose of development. It helps the designer to set proper values for the movie expand or movie (16x9) compress.
 Default value is 25.
- Service blanking (SBL). Switch the blanking of the lower half of the screen ON or OFF (to be used in combination with the vertical slope alignment).
- H60. Align straight horizontal lines if NTSC input (60 Hz) is used i.s.o. PAL (50 Hz).
- V60. Align straight vertical lines if NTSC input (60 Hz) is used i.s.o. PAL (50 Hz).

Figure 8-11

In the table below, you will find the GEOMETRY default values for the different sets.

	DEFAULT GEOMETRY VA	LUES	S (L01	LAR	SE SC	REEN	I)	
Alignment	Description	21" (4:3)	24" (16:9)	25" (4:3)	28" (4:3)	28" (16:9)	29" (4:3)	32" (16:9)
HP	Hor. Parallelogram	31	32	31	31	32	32	32
HB	Hor. Bow	31	32	31	31	32	32	32
HSH	Hor. Shift	35	27	35	35	27	27	27
EWW	East West Width	34	36	34	34	36	48	39
EWP	East West Parabola	33	20	33	33	20	20	20
UCP	Upper Corner Parabola	35	20	35	35	23	24	20
LCP	Lower Corner Parabola	35	25	35	35	25	28	25
EWT	East West Trapezium	35	28	35	35	28	28	28
VSL	Vert. Slope	33	37	33	33	37	37	37
VAM	Vert. Amplitude	26	30	26	26	30	39	30
VSC	Vert. S-correction	23	20	23	23	20	32	20
VSH	Vert. Shift	31	31	31	31	31	31	31
VX	Vert. Zoom	25	25	25	25	25	25	25

V60	Vert. Shift offset (60 Hz)	4	4	4	4	4	4	4

CL 16532008_054.pd

Figure 8-12

8.3.5 Audio

Figure 8-13

No alignments are needed for the audio sub menu. Use the given default values.

AT (Attack Time)

Default value is 8.

AF-M

Default value is 301.

Δ2Τ

Default value is 250.

QSS (Quasi Split Sound)

OFF for Intercarrier sets, ON for QSS sets.

FMI (Freq. Modulation Intercarrier)

OFF for QSS sets, ON for Intercarrier sets.

Circuit Description

Index of this chapter:

- Introduction
- Audio Signal Processing 2.
- Video Signal Processing
- Synchronisation 4
- Deflection 5.
- Power Supply 6.
- 7. Control
- 8. Abbreviations

Notes:

- Figures can deviate slightly from the actual situation, due to different set executions.
- For a good understanding of the following circuit descriptions, please use the block diagram in chapter 6, or the electrical diagrams in chapter 7. Where necessary, you will find a separate drawing for clarification.

9.1 Introduction

The L01 chassis is a global TV chassis for the model year 2001 and is used for TV sets with screen sizes from 14" - 21" (small screen) to 21" - 32" (large screen).

The standard architecture consists of a Main panel, a Picture Tube panel, a Side I/O panel (not al executions) and a Top Control panel.

The Main panel consists primarily of conventional components with hardly any surface mounted devices.

Figure 9-1

The functions for video processing, microprocessor (μP) and teletext (TXT) decoder are combined in one IC (TDA958xH), the so-called Ultimate One Chip (UOC). This chip is (surface) mounted on the copper side of the main panel.

The L01 is divided into 2 basic systems, i.e. mono and stereo sound. While the audio processing for the mono sound is done in the audio block of the UOC, an external audio processing IC is used for stereo sets.

The tuning system features 100 video channels with on-screen display. The main tuning system uses a tuner, a microcomputer, and a memory IC mounted on the main panel. Also, in some type numbers, an FM radio is implemented with 40 pre-set channels.

The microcomputer communicates with the memory IC, the customer keyboard, remote receiver, tuner, signal processor IC and the audio output IC via the I2C bus. The memory IC retains the settings for favourite stations, customer-preferred settings, and service/factory data.

The on-screen graphics and closed caption decoding are done within the microprocessor, and then sent to the signal processor IC to be added to the main signal.

The chassis uses a Switching Mode Power Supply (SMPS) for the main voltage source. The chassis has a 'hot' ground reference on the primary side and a cold ground reference on the secondary side of the power supply and the rest of the

9.2 **Audio Signal Processing**

9.2.1 Stereo

In stereo sets, the signal goes via the SAW filter (position 1004 in case of QSS demodulation and 1003 in case of Intercarrier demodulation), to the audio demodulator part of the UOC IC7200. The stereo audio output on pin 33 goes, via TS7206, to the stereo decoder 7831.

The switch inside the stereo decoder 7831 selects (via I²C) either the internal decoder or an external source.

The NICAM + 2CS AM/FM stereo decoder is an ITT MSP34X5. The output is fed to the to the audio amplifier (AN7522 at position 7901). The volume level is controlled at this IC (pin 9) by a control line (VolumeMute) from the microprocessor. The audio signal from 7901 is then sent to the speaker/headphone output panel.

Figure 9-3

9.2.2 Mono

In mono sets, the signal goes via the SAW filter (position 1004 in case of QSS demodulation and 1003 in case of Intercarrier demodulation), to the audio demodulator part of the UOC IC7200. The audio output on pin 48 goes directly, via buffer 7943, to the audio amplifier (AN7523 at position 7902). The volume level is controlled at this IC (pin 9) by a 'VolumeMute' control line from the microprocessor. The audio signal from IC7902 is then sent to the speaker/headphone output panel.

Figure 9-4 .eps

9.2.3 FM radio (if present)

The FM radio uses the 10.7 MHz concept. This SIF frequency is available at pin 10 of the tuner. Via a pre-amplifier (TS7209 and TS7210), the signal is fed for demodulation to either the UOC (for mono FM radio) or by the Micronas MSP34X5 (for stereo FM radio).

9.3 Video Signal Processing

9.3.1 Introduction

The video signal-processing path consists of the following parts:

- RF signal processing.
- · Video source selection.
- · Video demodulation.
- Luminance/Chrominance signal processing.
- RGB control.
- RGB amplifier

The processing circuits listed above are all integrated in the UOC TV processor. The surrounding components are for the adaptation of the selected application. The I²C bus is for defining and controlling the signals.

9.3.2 RF Signal Processing

The incoming RF signal goes to the tuner (pos. 1000), where the 38.9 MHz IF signal is developed and amplified. The IF signals then exits the tuner from pin 11 to pass through the SAW filter (position 1002 in case of QSS demodulation and 1003 in case of Intercarrier demodulation). The shaped signal is then applied to the IF processor part of the UOC (pos. 7200). Tuner AGC (Automatic Gain Control) will reduce the tuner gain and thus the tuner output voltage when receiving strong RF signals. Adjust the AGC take-over point via the Service Alignment Mode (SAM). The tuner AGC starts working when the video-IF input reaches a certain input level and will adjust this level via the I²C bus. The tuner AGC signal goes to the tuner (pin 1) via the open collector output (pin 22) of the UOC. The IC also generates an Automatic Frequency Control (AFC) signal that goes to the tuning system via the I2C bus, to provide frequency correction when needed.

The demodulated composite video signal is available at pin 38 and then buffered by transistor 7201.

9.3.3 Video Source Selection

The Composite Video Blanking Signal (CVBS) from buffer 7201 goes to the audio carrier trap filters (1200 and 1201) to remove the audio signal. The signal then goes to pin 40 of IC7200. The internal input switch selects the following input signals:

- Pin 40: terrestrial CVBS input
- Pin 42: external AV1 CVBS input
- Pin 44: external Side I/O CVBS or AV2 Luminance (Y) input
- Pin 45: external AV2 Chrominance (C) input

Figure 9-5

Once the signal source is selected, a chroma filter calibration is performed. The received colour burst sub-carrier frequency is used for this. Correspondingly, the chroma band pass filter for PAL processing or the cloche filter for SECAM processing is switched on. The selected luminance (Y) signal is supplied to the horizontal and vertical synchronisation processing circuit and to the luminance processing circuit. In the luminance-processing block, the luminance signal goes to the chroma trap filter. This trap is switched 'on' or 'off', depending on the colour burst detection of the chroma calibration circuit.

The group delay correction part can be switched between the BG and a flat group delay characteristic. This has the advantage that in multi-standard receivers no compromise has to be made for the choice of the SAW filter.

9.3.4 Video Demodulation

The colour decoder circuit detects whether the signal is a PAL, NTSC or SECAM signal. The result is made known to the auto system manager. The PAL/NTSC decoder has an internal clock generator, which is stabilised to the required frequency by using the 12 MHz clock signal from the reference oscillator of the microcontroller/teletext decoder.

The base-band delay line is used to obtain a good suppression of cross colour effects.

The Y signal and the delay line outputs U and V are applied to the luminance/chroma signal processing part of the TV processor.

9.3.5 Luminance/Chrominance Signal Processing

The output of the YUV separator is fed to the internal YUV switch, which switches between the output of the YUV separator or the external YUV (for DVD or PIP) on pins 51-53. Pin 50 is the input for the insertion control signal called 'FBL-1'. When this signal level becomes higher than 0.9 V (but less than 3 V), the RGB signals at pins 51, 52 and 53 are inserted into the picture by using the internal switches.

9.

Also some picture improvement features are implemented in this part:

- Black stretch This function corrects the black level of incoming signals, which have a difference between the black level and the blanking level. The amount of extension depends upon the difference between actual black level and the darkest part of the incoming video signal level. It is detected by means of an internal capacitor.
- White stretch This function adapts the transfer characteristic of the luminance amplifier in a non-linear way depending on the average picture content of the luminance signal. It operates in such a way that maximum stretching is obtained when signals with a low video level are received. For bright pictures, stretching is not active.
- Dynamic skin tone correction This circuit corrects (instantaneously and locally) the hue of those colours which are located in the area in the UV plane that matches the skin tone. The correction is dependent on the luminance, saturation and distance to the preferred axis.

The YUV signal is then fed to the colour matrix circuit, which converts it to R, G and B signals.

The OSD/TXT signal from the microprocessor is mixed with the main signal at this point, before being output to the CRT board (pins 56, 57 and 58).

9.3.6 **RGB Control**

The RGB control circuit enables the picture parameters contrast, brightness and saturation to be adjusted, by using a combination of the user menus and the remote control. Additionally automatic gain control for the RGB signals via cutoff stabilisation is achieved in this functional block to obtain an accurate biasing of the picture tube. Therefor this block inserts the cut-off point measuring pulses into the RGB signals during the vertical retrace period.

The following additional controls are used:

- Black current calibration loop Because of the 2-point black current stabilisation circuit, both the black level and the amplitude of the RGB output signals depend on the drive characteristics of the picture tube. The system checks whether the returning measuring currents meet the requirements, and adapt the output level and gain of the circuit when necessary. After stabilisation of the loop, the RGB drive signals are switched on. The 2-point black level system adapts the drive voltage for each cathode in such a way that the two measuring currents have the right value. This is done with the measurement pulses during the frame flyback. During the first frame, three pulses with a current of 8 μ A are generated to adjust the cut off voltage. During the second frame, three pulses with a current of 20 μA are generated to adjust the 'white drive'. This has as a consequence, that a change in the gain of the output stage will be compensated by a gain change of the RGB control circuit. Pin 55 (BLKIN) of the UOC is used as the feedback input from the CRT base panel.
- Blue stretch This function increases the colour temperature of the bright scenes (amplitudes which exceed a value of 80% of the nominal amplitude). This effect is obtained by decreasing the small signal gain of the red and green channel signals, which exceed this 80% level.
- Beam current limiting A beam current limiting circuit inside the UOC handles the contrast and brightness control for the RGB signals. This prevents the CRT from being overdriven, which could otherwise cause serious damage in the line output stage. The reference used for this purpose is the DC voltage on pin 54 (BLCIN) of the TV processor. Contrast and brightness reduction of the RGB output signals is therefore proportional to the voltage present on this pin. Contrast reduction starts when the voltage on pin 54 is lower than 2.8 V. Brightness reduction starts when the voltage on pin 54 is less than 1.7 V. The

voltage on pin 54 is normally 3.3 V (limiter not active). During set switch 'off', the black current control circuit generates a fixed beam current of 1 mA. This current ensures that the picture tube capacitance is discharged. During the switch-off period, the vertical deflection is placed in an over-scan position, so that the discharge is not visible on the screen.

9.3.7 RGB Amplifier

From outputs 56, 57 and 58 of IC7200, the RGB signals are applied to the integrated output amplifier (7330) on the CRT panel. Via the outputs 7, 8 and 9, the picture tube cathodes are

The supply voltage for the amplifier is +200 V and is derived from the line output stage.

9.3.8 SCAVEM (if present)

The SCAn VElocity Modulation (SCAVEM) circuitry is implemented in the layout of the picture tube panel. It is thus not an extra module. This circuit influences the horizontal deflection as a function of the picture content. In an ideal square wave, the sides are limited in slope due to a limited bandwidth (5 MHz).

SCAVEM will improve the slope as follows:

At a positive slope, a SCAVEM current is generated which supports the deflection current. At the first half of the slope, the spot is accelerated and the picture is darker. At the second half of the slope, the spot is delayed and the slope becomes steeper.

At the end of the slope, the SCAVEM-current decays to zero and the spot is at the original position. An overshoot occurs which improves the impression of sharpness.

At the negative slope, the SCAVEM-current counteracts the deflection. During the first half of the slope, the spot is delayed and the slope becomes steeper. During the second half the spot accelerates, the SCAVEM-current is zero at the end of the slope.

Via the three resistors R3371, R3379 and R3386, Red, Green and Blue are added together, buffered and offered to the emitter of TS7363. On the collector of this transistor, configured in a common base, the sum of these 3 signals is obtained. Via the emitter follower formed with TS7360, this signal is conveyed to the differentiator C2376 and R3392. Only the high frequencies are differentiated (small RC-time).

The positive and negative pulses of this signal drive respectively TS7365 and TS7362 into conductivity. The DC setting of the output stage is set by R3363, R3374, R3378 and R3384. The working voltage of the transistors is settled at half the supply voltage.

At the positive section of the pulse, the current flows through TS7365 and the SCAVEM coil. At the negative section of the pulse, the current flows through TS7362 and the SCAVEM coil.

9.4 **Synchronisation**

Inside IC7200 (part D), the vertical and horizontal sync-pulses are separated. These 'H' and 'V' signals are synchronised with the incoming CVBS signal. They are then fed to the H- and Vdrive circuits and to the OSD/TXT circuit for synchronisation of the On Screen Display and Teletext (or Closed Caption) information.

9.5 **Deflection**

9.5.1 **Horizontal Drive**

The horizontal drive signal is obtained from an internal VCO, which is running at twice the line frequency. This frequency is divided by two, to lock the first control loop to the incoming signal.

When the IC is switched 'on', the 'Hdrive' signal is suppressed until the frequency is correct.

The 'Hdrive' signal is available at pin 30. The 'Hflybk' signal is fed to pin 31 to phase lock the horizontal oscillator, so that TS7462 cannot switch 'on' during the flyback time.

The 'EWdrive' signal for the E/W circuit (if present) is available on pin 15, where it drives transistor 7400 to make linearity corrections in the horizontal drive.

When the set is switched on, the '+8V' voltage goes to pin 9 of IC7200. The horizontal drive starts up in a soft start mode. It starts with a very short $T_{\rm ON}$ time of the horizontal output transistor. The $T_{\rm OFF}$ of the transistor is identical to the time in normal operation. The starting frequency during switch on is therefore about 2 times higher than the normal value. The 'on' time is slowly increased to the nominal value in 1175 ms. When the nominal value is reached, the PLL is closed in such a way that only very small phase corrections are necessary.

The 'EHTinformation' line on pin 11 is intended to be used as a 'X-ray' protection. When this protection is activated (when the voltage exceeds 6 V), the horizontal drive (pin 30) is switched 'off' immediately. If the 'H-drive' is stopped, pin 11 will become low again. Now the horizontal drive is again switched on via the slow start procedure.

The 'EHTinformation' line (Aquadag) is also fed back to the UOC IC7200 pin 54, to adjust the picture level in order to compensate for changes in the beam current.

The filament voltage is monitored for 'no' or 'excessive' voltage. This voltage is rectified by diode 6447 and fed to the emitter of transistor TS7443. If this voltage goes above 6.8 V, transistor TS7443 will conduct, making the 'EHT0' line 'high'. This will immediately switch off the horizontal drive (pin 30) via the slow stop procedure.

The horizontal drive signal exits IC7200 at pin 30 and goes to TS7462, the horizontal driver transistor. The signal is amplified and coupled to the base circuit of TS7460, the horizontal output transistor. This will drive the line output transformer (LOT) and associated circuit. The LOT provides the extra high voltage (EHT), the VG2 voltage and the focus and filament voltages for the CRT, while the line output circuit drives the horizontal deflection coil.

9.5.2 Vertical Drive

A divider circuit performs the vertical synchronisation. The vertical ramp generator needs an external resistor (R3245, pin 20) and capacitor (C2244, pin 21). A differential output is available at pins 16 and 17, which are DC-coupled with the vertical output stage.

To avoid damage of the picture tube when the vertical deflection fails, the 'V_GUARD' output is fed to the beam current limiting input. When a failure is detected, the RGB-outputs are blanked. When no vertical deflection output stage is connected, this guard circuit will also blank the output signals.

These 'V_DRIVE+' and 'V_DRIVE-' signals are applied to the input pins 1 and 2 of IC 7471 (full bridge vertical deflection amplifier). These are voltage driven differential inputs. As the driver device (IC 7200) delivers output currents, R3474 and R3475 convert them to voltage. The differential input voltage is compared with the voltage across measuring resistor R3471 that provides internal feedback information. The voltage across this measuring resistor is proportional to the output current, which is available at pins 4 and 7 where they drive the vertical deflection coil (connector 0222) in phase opposition. IC 7471 is supplied by +13 V. The vertical flyback voltage is determined by an external supply voltage at pin 6 (VlotAux+50V). This voltage is almost totally available as

flyback voltage across the coil, this being possible due to the absence of a coupling capacitor (which is not necessary, due to the 'bridge' configuration).

9.5.3 Deflection Corrections

The Linearity Correction

A constant voltage on the horizontal deflection coil should result in a sawtooth current. This however is not the case as the resistance of the coil is not negligible. In order to compensate for this resistance, a pre-magnetised coil L5457 is used. R3485 and C2459 ensure that L5457 does not excite, because of its own parasite capacitance. This L5457 is called the 'linearity coil'.

The Mannheim Effect

When clear white lines are displayed, the high-voltage circuit is heavily loaded. During the first half of the flyback, the high voltage capacitors are considerable charged. At that point in time, the deflection coil excites through C2465. This current peak, through the high-voltage capacitor, distorts the flyback pulse. This causes synchronisation errors, causing an oscillation under the white line.

During t3 - t5, C2490//2458 is charged via R3459. At the moment of the flyback, C2490//2458 is subjected to the negative voltage pulses of the parabola as a result of which D6465 and D6466 are conducting and C2490//2458 is switched in parallel with C2456//2457. This is the moment the high-voltage diodes are conducting. Now extra energy is available for excitation through C2465 and the line deflection. As a consequence, the flyback pulse is less distorted.

The S-Correction

Since the sides of the picture are further away from the point of deflection than from the centre, a linear sawtooth current would result in a non-linear image being scanned (the centre would be scanned slower than the sides). For the centre-horizontal line, the difference in relation of the distances is larger then those for the top and bottom lines. An S-shaped current will have to be superimposed onto the sawtooth current. This correction is called finger-length correction or S-correction.

C2456//2457 is relatively small, as a result of which the sawtooth current will generate a parabolic voltage with negative voltage peaks. Left and right, the voltage across the deflection coil decreases, and the deflection will slow down; in the centre, the voltage increases and deflection is faster. The larger the picture width, the higher the deflection current through C2456//2457. The current also results in a parabolic voltage across C2484//2469, resulting in the finger length correction proportionally increasing with the picture width. The east/west drive signal will ensure the largest picture width in the centre of the frame. Here the largest correction is applied.

East/West Correction

In the L01, there are three types of CRTs, namely the 100°, 110° and wide screen CRTs. The 100° CRT is raster-correction-free and does not need East/West correction. The 110° 4:3 CRT comes with East/West correction and East/West protection.

The wide screen TV sets have all the correction of the 110 4:3 CRT and also have additional picture format like the 4:3 format, 16:9, 14:9, 16:9 zoom, subtitle zoom and the Super-Wide picture format

A line, written at the upper- or lower side of the screen, will be larger at the screen centre when a fixed deflection current is used. Therefore, the amplitude of the deflection current must be increased when the spot approaches the centre of the screen. This is called the East/West or pincushion correction.

The 'Ewdrive' signal from pin 15 of IC7200 takes care for the correct correction. It drives FET TS7400. It also corrects breathing of the picture, due to beam current variations (the

EHT varies dependent of the beam current). This correction is derived from the 'EHTinformation' line.

Two protections are built-in for the E/W circuit: over-current and over-voltage protection. See paragraph Power Supply.

Panorama

The panorama function is only used in 16:9 sets. This is a function to enable the 4:3 and Super-Wide feature. It drives the 'Bass_panorama' line, to activate relay 1400. When this relay is switched on, the capacitors 2453//2454 are added in parallel to the default S-correction capacitors 2456//2457. This results in an increased capacitance, a lower resonance frequency of the line deflection coil and the S-correction capacitors and therefore a less steep S-corrected line deflection current.

9.5.4 Rotation (only present in widescreen sets)

To cope with the different earth magnetism situations in the world, a rotation coil is added in widescreen sets. This coil is controlled by the rotation circuitry (see diagram A15). The amount of frame rotation is user controlled via the the PWM output (pin 77) of the UOC.

With the tilt setting at '-10', the PWM duty cycle is 0.1 (leftmost tuning).

With the setting at '+10', the duty cycle is 0.9 (rightmost tuning). The output of amplifier IC7171 is a DC-voltage in the range from 0 (user setting = -10), via 6 V (user setting = 0) to 12 V (user setting = +10).

9.6 Power Supply

Figure 9-6

Figure 9-7

9.6.1 Introduction

The supply is a Switching Mode Power Supply (SMPS). The frequency of operation varies with the circuit load. This 'Quasi-Resonant Flyback' behaviour has some important benefits compared to a 'hard switching' fixed frequency Flyback converter. The efficiency can be improved up to 90%, which results in lower power consumption. Moreover the supply runs cooler and safety is enhanced.

The power supply starts operating when a DC voltage goes from the rectifier bridge via T5520, R3532 to pin 8. The operating voltage for the driver circuit is also taken from the 'hot' side of this transformer.

The switching regulator IC7520 starts switching the FET 'on' and 'off', to control the current flow through the primary winding of transformer 5520. The energy stored in the primary winding during the 'on' time is delivered to the secondary windings during the 'off' time.

The 'MainSupply' line is the reference voltage for the power supply. It is sampled by resistors 3543 and 3544 and fed to the input of the regulator 7540/6540. This regulator drives the feedback optocoupler 7515 to set the feedback control voltage on pin 3 of 7520.

The power supply in the set is 'on' any time AC power goes to the set.

Derived Voltages

The voltages supplied by the secondary windings of T5520 are:

- 'MainAux' for the audio circuit (voltage depends on set execution, see table below).
- 3.3 V and 3.9 V for the microprocessor and
- 'MainSupply' for the horizontal output (voltage depends on set execution, see table below).

Other supply voltages are provided by the LOT. It supplies ± 50 V (only for large screen sets), ± 13 V, ± 8 V, ± 5 V and a ± 200 V source for the video drive. The secondary voltages of the LOT are monitored by the 'EHTinformation' lines. These lines are fed to the video processor part of the UOC IC7200 on pins 11 and 34

This circuit will shut 'off' the horizontal drive in case of overvoltage or excessive beam current.

Circuit Description

Figure 9-8

	-	Power supply v	oltages L	01

Figure 9-9

Degaussing

When the set is switched on, the degaussing relay 1515 is immediately activated as transistor 7580 is conducting. Due to the RC-time of R3580 and C2580, it will last about 3 to 4 seconds before transistor 7580 is switched off.

9.6.2 **Basic IC Functionality**

For a clear understanding of the Quasi-Resonant behaviour, it is possible to explain it by a simplified circuit diagram (see Figure below). In this circuit diagram, the secondary side is transferred to the primary side and the transformer is replaced by an inductance L_P . C_D is the total drain capacitance including the resonance capacitor C_B, parasitic output capacitor C_{OSS} of the MOSFET and the winding capacitance C_W of the transformer. The turns ratio of the transformer is represented by n (N_P/N_S) .

Figure 9-10

In the Quasi-Resonant mode each period can be divided into four different time intervals, in chronological order:

- Interval 1: t0 < t < t1 primary stroke At the beginning of the first interval, the MOSFET is switched 'on' and energy is stored in the primary inductance (magnetisation). At the end, the MOSFET is switched 'off' and the second interval starts
- Interval 2: t1 < t < t2 commutation time In the second interval, the drain voltage will rise from almost zero to $V_{IN}+n\bullet(V_{OUT}+V_F)$. V_F is the forward voltage drop of de diode that will be omitted from the equations from now on. The current will change its positive derivative, corresponding to $V_{\text{IN}}\!/L_{\text{P}},$ to a negative derivative, corresponding to -n•V $_{OUT}$ /L $_{P}$.
- Interval 3: t2 < t < t3 secondary stroke In the third interval, the stored energy is transferred to the output, so the diode starts to conduct and the inductive current I_L will decrease. In other words, the transformer will be demagnetised. When the inductive current has become zero the next interval begins.
- Interval 4: t3 < t < t00 resonance time In the fourth interval, the energy stored in the drain capacitor C_D will start to resonate with the inductance L_P. The voltage and current waveforms are sinusoidal waveforms. The drain voltage will drop from $V_{IN}+n\bullet V_{OUT}$ to $V_{IN}-n\bullet V_{OUT}$.

Frequency Behaviour

The frequency in the QR-mode is determined by the power stage and is not influenced by the controller (important parameters are L_P and C_D). The frequency varies with the input voltage V_{IN} and the output power $P_{\text{OUT}}.$ If the required output power increases, more energy has to be stored in the transformer. This leads to longer magnetising t_{PRIM} and demagnetising t_{SEC} times, which will decrease the frequency. See the frequency versus output power characteristics below. The frequency characteristic is not only output power-, but also input voltage dependent. The higher the input voltage, the smaller t_{PRIM}, so the higher the frequency will be.

Figure 9-11

Point P1 is the minimum frequency f_{MIN} that occurs at the specified minimum input voltage and maximum output power required by the application. Of course the minimum frequency has to be chosen above the audible limit (>20 kHz).

Start-up Sequence

When the rectified AC voltage V_{IN} (via the centre tap connected to pin 8) reaches the Mains dependent operation level (Mlevel: between 60 and 100 V), the internal 'Mlevel switch' will be opened and the start-up current source is enabled to charge capacitor C2521 at the V_{CC} pin as shown below.

The 'soft start' switch is closed when the V_{CC} reaches a level of 7 V and the 'soft start' capacitor C_{SS} (C2522, between pin 5 and the sense resistor R3526), is charged to 0.5 V.

Once the V_{CC} capacitor is charged to the start-up voltage V_{CC} - $_{start}$ (11 V), the IC starts driving the MOSFET. Both internal current sources are switched 'off' after reaching this start-up voltage. Resistor R_{SS} (3524) will discharge the 'soft start' capacitor, such that the peak current will slowly increase. This to prevent 'transformer rattle'.

During start-up, the V_{CC} capacitor will be discharged until the moment that the primary auxiliary winding takes over this voltage.

Figure 9-12

The moment that the voltage on pin 1 drops below the 'under voltage lock out' level (UVLO = \pm 9 V), the IC will stop switching and will enter a safe restart from the rectified mains voltage.

Operation

The supply can run in three different modes depending on the output power:

- Quasi-Resonant mode (QR) The QR mode, described above, is used during normal operation. This will give a high efficiency.
- Frequency Reduction mode (FR) The FR mode (also called VCO mode) is implemented to decrease the switching losses at low output loads. In this way the efficiency at low output powers is increased, which enables power consumption smaller than 3 W during stand-by. The voltage at the pin 3 (Ctrl) determines where the frequency reduction starts. An external Ctrl voltage of 1.425 V corresponds with an internal VCO level of 75 mV. This fixed VCO level is called V_{VCO,start}. The frequency will be reduced in relation to the VCO voltage between 75 mV and 50 mV (at levels larger than 75 mV, Ctrl voltage < 1.425V, the oscillator will run on maximum frequency f_{oscH} = 175 kHz typically). At 50 mV (V_{VCO,max}) the frequency is reduced to the minimum level of 6 kHz. Valley switching is still active in this mode.
- Minimum Frequency mode (MinF) At VCO levels below 50 mV, the minimum frequency will remain on 6 kHz, which is called the MinF mode. Because of this low frequency, it is possible to run at very low loads without having any output regulation problems.

Figure 9-13

Safe-Restart Mode

This mode is introduced to prevent the components from being destroyed during eventual system fault conditions. It is also used for the Burst mode. The Safe-Restart mode will be entered if it is triggered by one of the following functions:

- Over voltage protection,
- · Short winding protection,
- Maximum 'on time' protection,
- V_{CC} reaching UVLO level (fold back during overload),
- Detecting a pulse for Burst mode,
- Over temperature protection.

When entering the Safe-Restart mode, the output driver is immediately disabled and latched. The $V_{\rm CC}$ winding will not charge the $V_{\rm CC}$ capacitor anymore and the $V_{\rm CC}$ voltage will drop until UVLO is reached. To recharge the $V_{\rm CC}$ capacitor, the internal current source $(I_{\rm (restart)(VCC)})$ will be switched 'on' to initiate a new start-up sequence as described before. This Safe-Restart mode will persist until the controller detects no faults or burst triggers.

Standby

The set goes to Standby in the following cases:

- After pressing the 'standby' key on the remote control.
- When the set is in protection mode.

In Standby, the power supply works in 'burst mode'. Burst mode can be used to reduce the power consumption below 1 W at stand-by. During this mode, the controller is active (generating gate pulses) for only a short time and for a longer time inactive waiting for the next burst cycle.

In the active period the energy is transferred to the secondary and stored in the buffer capacitor C_{STAB} in front of the linear stabiliser (see Figure below). During the inactive period, the load (e.g. microprocessor) discharges this capacitor. In this mode, the controller makes use of the Safe-Restart mode.

Figure 9-14

The system enters burst mode standby when the microprocessor activates the 'Stdby_con' line. When this line is pulled high, the base of TS7541 is allowed to go high. This is triggered by the current from collector TS7542. When TS7541 turns 'on', the opto-coupler (7515) is activated, sending a large current signal to pin 3 (Ctrl). In response to this signal, the IC stops switching and enters a 'hiccup' mode. This burst activation signal should be present for longer than the 'burst blank' period (typically 30 μ s): the blanking time prevents false burst triggering due to spikes.

Burst mode standby operation continues until the microcontroller pulls the 'Stdby_con' signal low again. The base of TS7541 is unable to go high, thus cannot turn 'on'. This will disable the burst mode. The system then enters the start-up sequence and begins normal switching behaviour.

For a more detailed description of one burst cycle, three time intervals are defined:

- t1: Discharge of V_{CC} when gate drive is active During the first interval, energy is transferred, which result in a rampup of the output voltage (V_{STAB}) in front of the stabiliser. When enough energy is stored in the capacitor, the IC will be switched 'off' by a current pulse generated at the secondary side. This pulse is transferred to the primary side via the opto coupler. The controller will disable the output driver (safe restart mode) when the current pulse reaches a threshold level of 16 mA into the Ctrl pin. A resistor R₁ (R3519) is placed in series with the opto coupler, to limit the current going into the Ctrl pin. Meanwhile the V_{CC} capacitor is discharged but has to stay above V_{UVLO}.
- t2: Discharge of V_{CC} when gate drive is inactive During the second interval, the V_{CC} is discharged to V_{UVLO}. The output voltage will decrease depending on the load.
- t3: Charge of V_{CC} when gate drive is inactive The third interval starts when the UVLO is reached. The internal current source charges the V_{CC} capacitor (also the soft start capacitor is recharged). Once the V_{CC} capacitor is charged to the start-up voltage, the driver is activated and a new burst cycle is started.

Figure 9-15

9.6.3 Protection Events

The SMPS IC7520 has the following protection features:

Demagnetisation sense

This feature guarantees discontinuous conduction mode operation in every situation. The oscillator will not start a new primary stroke until the secondary stroke has ended. This is to ensure that FET 7521 will not turn on until the demagnetisation of transformer 5520 is completed. The function is an additional protection feature against:

- saturation of the transformer,
- damage of the components during initial start-up,
- an overload of the output.

The demag(netisation) sense is realised by an internal circuit that guards the voltage (Vdemag) at pin 4 that is connected to V_{CC} winding by resistor R_1 (R3522). The Figure below shows the circuit and the idealised waveforms across this winding.

Figure 9-16

Over Voltage Protection

The Over Voltage Protection ensures that the output voltage will remain below an adjustable level. This works by sensing the auxiliary voltage via the current flowing into pin 4 (DEM) during the secondary stroke. This voltage is a well-defined replica of the output voltage. Any voltage spikes are averaged by an internal filter.

If the output voltage exceeds the OVP trip level, the OVP circuit switches the power MOSFET 'off'.

Next, the controller waits until the 'under voltage lock out' level (UVLO = \pm 9 V) is reached on pin 1 (V_{CC}). This is followed by a safe restart cycle, after which switching starts again. This process is repeated as long as the OVP condition exists. The output voltage, at which the OVP function trips, is set by the demagnetisation resistor R3522.

Over Current Protection

The internal OCP protection circuit limits the 'sense' voltage on pin 5 to an internal level.

Over Power Protection

During the primary stroke, the rectified AC input voltage is measured by sensing the current drawn from pin 4 (DEM). This current is dependent on the voltage on pin 9 of transformer 5520 and the value of R3522. The current information is used to adjust the peak drain current, which is measured via pin I_{SENSE} .

Short Winding Protection

If the 'sense' voltage on pin 5 exceeds the short winding protection voltage (0.75 V), the converter will stop switching. Once $V_{\rm CC}$ drops below the UVLO level, capacitor C2521 will be recharged and the supply will start again. This cycle will be repeated until the short circuit is removed (safe restart mode). The short winding protection will also protect in case of a secondary diode short circuit.

This protection circuit is activated after the leading edge blanking time (LEB).

LEB time

The LEB (Leading Edge Blanking) time is an internally fixed delay, preventing false triggering of the comparator due to current spikes. This delay determines the minimum 'on' time of the controller.

Over Temperature protection

When the junction temperature exceeds the thermal shutdown temperature (typ. 140° C), the IC will disable the driver. When the V_{CC} voltage drops to UVLO, the V_{CC} capacitor will be recharged to the $V_{(start)}$ level. If the temperature is still too high, the V_{CC} voltage will drop again to the UVLO level (Safe-Restart mode). This mode will persist until the junction temperature drops 8 degrees typically below the shutdown temperature.

Mains dependent operation enabling level

To prevent the supply from starting at a low input voltage, which could cause audible noise, a mains detection is implemented (Mlevel). This detection is provided via pin 8, that detects the minimum start-up voltage between 60 and 100 V. As previous mentioned, the controller is enabled between 60 and 100 V. An additional advantage of this function is the protection against a disconnected buffer capacitor ($C_{\rm IN}$). In this case, the supply will not be able to start-up because the $V_{\rm CC}$ capacitor will not be charged to the start-up voltage.

9.7 Control

Figure 9-17

9.7.1 Introduction

The microprocessor part of the UOC has the complete control and teletext on board. User menu, Service Default Mode, Service Alignment Mode and Customer Service Mode are generated by the $\mu P.$ Communication to other ICs is done via the $l^2 C\text{-}bus.$

9.7.2 I²C-Bus

The main control system, which consists of the microprocessor part of the UOC (7200), is linked to the external devices (tuner, NVM, MSP, etc) by means of the l²C-bus. An internal l²C-bus is used to control other signal processing functions, like video processing, sound IF, vision IF, synchronisation, etc.

9.7.3 User Interface

There are two control signals, called 'KEYBOARD_protn' and 'IR'. Users can interact either through the Remote Control transmitter, or by activation of the appropriate keyboard buttons.

The L01 uses a remote control with RC5 protocol. The incoming signal is connected to pin 67 of the UOC. The 'Top Control' keyboard, connected to UOC pin 80, can also control the set. Button recognition is done via a voltage divider. The 'KEYBOARD_protn' line, also serves to detect faults in the E/W circuit, which would require the μP to shut down the set (by forcing the power supply in standby mode).

The front LED (6691) is connected to an output control line of the microprocessor (pin 5). It is activated to provide the user information about whether or not the set is working correctly (e.g., responding to the remote control or fault condition)

9.7.4 Sound Interface

There are three control signals, called 'Volume_Mute', 'Treble_Buzzer_Hosp_app' and 'Bass_panorama'.

The 'Volume_Mute' line controls the sound level output of the audio amplifier or to mute it in case of no video identification or from user command. This line also controls the volume level during set switch 'on' and 'off' (to prevent audio plop).

The 'Treble' and 'Bass' lines have another functionality:

- The 'Bass_panorama' line is used to switch the panorama mode in widescreen sets (to fit 4:3 pictures into a 16:9 display, it is possible to apply a panoramic horizontal distortion, to make a screen-fitting picture without black sidebars or lost video).
- The 'Treble_Buzzer_Hosp_app' is used in ITV applications for other feautures, and in widescreen sets to enable the 'Tilt' feature (via R3172 on diagram A8) in the deflection part.

9.7.5 In- and Output Selection

For the control of the input and output selections, there are three lines:

- STATUS1 This signal provides information to the microprocessor on whether a video signal is available on the SCART1 AV input and output port.
 - 0 to 2 V: INTERNAL 4:3
 - 4.5 to 7 V: EXTERNAL 16:9
 - 9.5 to 12 V: EXTERNAL 4:3
- STATUS2 This signal provides information to the microprocessor on whether a video signal is available on the SCART2 AV input and output port (signal is low). For sets with an SVHS input, it provides the additional information if a Y/C or CVBS source is present (signal is high). The presence of an external Y/C source makes this line 'high' while a CVBS source makes the line 'low'.
 - 0 to 2 V: INTERNAL 4:3
 - 4.5 to 7 V: EXTERNAL 16:9

- 9.5 to 12 V: EXTERNAL 4:3
- SEL-MAIN-FRNT-RR This is the 'source select control' signal from the microprocessor. This control line is under user control or can be activated by the other two control lines.

9.7.6 Power Supply Control

The microprocessor part is supplied with 3.3 V and 3.9 V both derived from the 'MainAux' voltage via a 3V3 stabiliser (7560) and a diode.

Two signals are used to control the power supply:

- Stdby_con This signal is generated by the microprocessor when over-current takes place at the 'MainAux' line. This is done to enable the power supply into standby burst mode, and to enable this mode during a protection. This signal is 'low' under normal operation conditions and goes to 'high' (3.3 V) under 'standby' and 'fault' conditions.
- POWER_DOWN This signal is generated by the power supply. Under normal operating conditions this signal is 'high' (3.3 V). During 'standby' mode, this signal is a pulse train of approx. 10 Hz and a 'high' duration of 5 ms. It is used to give information to the UOC about the fault condition in the Audio amplifier supply circuit. This information is generated by sensing the current on the 'MainAux' line (using voltage drop across R3564 to trigger TS7562). This signal goes 'low' when the DC-current on the 'MainAux' line exceeds 1.6 2.0 A. It is also used to give an early warning to the UOC about a power failure. Then the information is used to mute the sound amplifier to prevent a switch off noise and to solve the switch-off spot.

9.7.7 Tuner IF

Pin 3 of the UOC (SEL-IF-LL'_M-TRAP), is an output pin to switch the SAW-filter to the appropriate system.

- If UOC pin 3 is 'low', the selected system is:
 - West Europe: PAL B/G, I, SECAM L/L'
 - East Europe: PAL B/G
 - Asia Pacific: NTSC M
- If UOC pin 3 is 'high', the selected system is:
 - West Europe: SECAM L', L'-NICAM
 - East Europe: PAL D/K
 - Asia Pacific: PAL B/G, D/K, I

Note: For West Europe, two separate SAW filters (1002 and 1004) are used for video and audio (Quasi Split Sound demodulation). For East Europe, one SAW filter (1003) is used for both (Intercarrier demodulation).

9.7.8 Protection Events

Several protection events are controlled by the UOC:

- **BC protection**, to protect the picture tube from a too high beam current. The UOC has the capability of measuring the normal back level current during the vertical flyback. So if for some reason the CRT circuit is malfunctioning (i.e. high beam current), the normal black current will be out of the 75 μA range, and the UOC will trigger the power supply to shut down. However, this is a high beam-current situation, the TV screen will be bright white before the set is shut down.
- I2C protection, to check whether all I²C IC's are functioning.

In case one of these protections is activated, the set will go into 'standby'. The 'on' and 'standby' LEDs are controlled via the UOC.

B-TXT

CC

DBX

2CS	2 Carrier (or Channel) Stereo
ACI	Automatic Channel Installation:
	algorithm that installs TV sets directly
	from cable network by means of a
	predefined TXT page
ADC	Analogue to Digital Converter

AFC Automatic Frequency Control: control signal used to tune to the correct

frequency

AFT Automatic Fine Tuning

AGC Automatic Gain Control: algorithm that

controls the video input of the

featurebox

AM Amplitude Modulation

AP Asia Pacific

AR Aspect Ratio: 4 by 3 or 16 by 9
ATS Automatic Tuning System
AV External Audio Video
AVL Automatic Volume Level
BC-PROT Beam Current Protection
BCL Beam Current Limitation
B/G Monochrome TV system. Sound

carrier distance is 5.5 MHz

BLC-INFORMATION Black current informationrmation

BTSC Broadcast Television Standard

Committee. Multiplex FM stereo sound system, originating from the USA and used e.g. in LATAM and AP-NTSC

countries Blue teletext Closed Caption Computer aided rePair

ComPair Computer aided rePair
CRT Cathode Ray Tube or picture tube

CSM Customer Service Mode
CTI Colour Transient Improvement:

manipulates steepness of chroma

transients

CVBS Composite Video Blanking and

Synchronisation

DAC Digital to Analogue Converter
DBE Dynamic Bass Enhancement: extra

low frequency amplification

Dynamic Bass Expander

D/K Monochrome TV system. Sound

carrier distance is 6.5 MHz

DFU Direction For Use: description for the

end user

DNR Dynamic Noise Reduction
DSP Digital Signal Processing

DST Dealer Service Tool: special remote

control designed for dealers to enter

e.g. service mode
DVD Digital Versatile Disc
EEPROM Electrically Erasable and

Programmable Read Only Memory

EHT Extra High Tension
EHT-INFORMATION Extra High Tension

EU Europe

EW East West, related to horizontal

deflection of the set

EXT External (source), entering the set via

SCART or Cinch

FBL Fast Blanking: DC signal

accompanying RGB signals

FILAMENT Filament of CRT
FLASH Flash memory
FM Field Memory
FM Frequency Modulation

HA Horizontal Acquisition: horizontal sync

pulse coming out of the HIP

L01.1E AB Circuit Description

Horizontal Flyback Pulse: horizontal HFE sync pulse from large signal deflection ΗP Headphone Colour phase control for NTSC (not Hue the same as 'Tint') Monochrome TV system. Sound carrier distance is 6.0 MHz I2C Integrated IC bus Intermediate Frequency IF IIC Integrated IC bus Scan mode where two fields are used Interlaced to form one frame. Each field contains half the number of the total amount of lines. The fields are written in "pairs", causing line flicker. ITV Institutional TV LATAM Latin America Light Emitting Diode LED L/L' Monochrome TV system. Sound carrier distance is 6.5 MHz. L' is Band I, L is all bands except for Band I LNA Low Noise Amplifier LS Large Screen LS Loudspeaker LSP Large signal panel M/N Monochrome TV system. Sound carrier distance is 4.5 MHz MSP Multistandard Sound Processor: ITT sound decoder Mute-Line MUTE NC Not Connected NICAM Near Instantaneous Compounded Audio Multiplexing. This is a digital sound system, mainly used in Europe. NTSC National Television Standard Committee. Colour system mainly used in North America and Japan. Colour carrier NTSC M/N = 3.579545 MHz, NTSC 4.43 = 4.433619 MHz (this is a VCR norm, it is not transmitted off-air) NVM Non Volatile Memory: IC containing TV related data e.g. alignments OB Option Byte OC Open Circuit OSD On Screen Display Phase Alternating Line. Colour system PAL mainly used in West Europe (colour carrier = 4.433619 MHz) and South America (colour carrier PAL M = 3.575612 MHz and PAL N = 3.582056 MHz) PCB Printed Circuit board PIP Picture In Picture Phase Locked Loop. Used for e.g. PΠ FST tuning systems. The customer can give directly the desired frequency POR Power-On Reset Progressive Scan Scan mode where all scan lines are displayed in one frame at the same time, creating a double vertical resolution. PTP Picture Tube Panel (or CRT-panel) RAM Random Access Memory RC Remote Control handset RC5 Remote Control system 5, signal from

the remote control receiver
